## Commenti

### Protezione dei adulti

The passenger compartment remained stable in the frontal impact. Dummy readings indicated good protection of the front passengers' knees and femurs. Additional tests demonstrated that similar protection would be offered to occupants of different sizes and to those sat in different positions. In the side barrier impact, protection of most body regions was good, and that of the chest was adequate. In the more severe side pole test, dummy readings of rib deflection indicated marginal protection of the chest. Protection against whiplash injuries in the event of a rear-end collision was good.

### Bambini

Based on dummy readings in the impact tests, the car lost only a fraction of a point for its protection of the 3 year infant. Forward movement of the head was not excessive in the frontal impact and the dummy was properly contained within the protective shell of its restraint in the side barrier test, as was the 18 month dummy. A switch is available as an option which disables the passenger airbag, allowing a rearward facing child restraint to be used in that seating position. The test cars were not equipped with the switch and no assessment was done. The car

had labels which warned clearly of the dangers of using a rearward facing restraint in the passenger seat without first disabling the airbag.

#### **Pedoni**

The bumper provided good protection to pedestrians' legs in most of the area tested, but was poor in others. The front edge of the bonnet was predominantly poor. In most areas likely to be struck by a child's head, the bonnet offered good levels of protection. However, the protection offered to the head of an adult was rated as poor for most of the areas tested.

#### **Dispositivi di sicurezza**

Electronic stability control is fitted as standard equipment on all variants. The front seats have a seatbelt reminder system as standard. A driver-set speed limitation device is available as an option.
